INTRODUCTION

Students and teachers often have trouble finding course details or knowing who teaches each class.

This happens because academic data is spread across many systems and formats.

As a result, it becomes slow and difficult to get the right information, which affects academic planning.

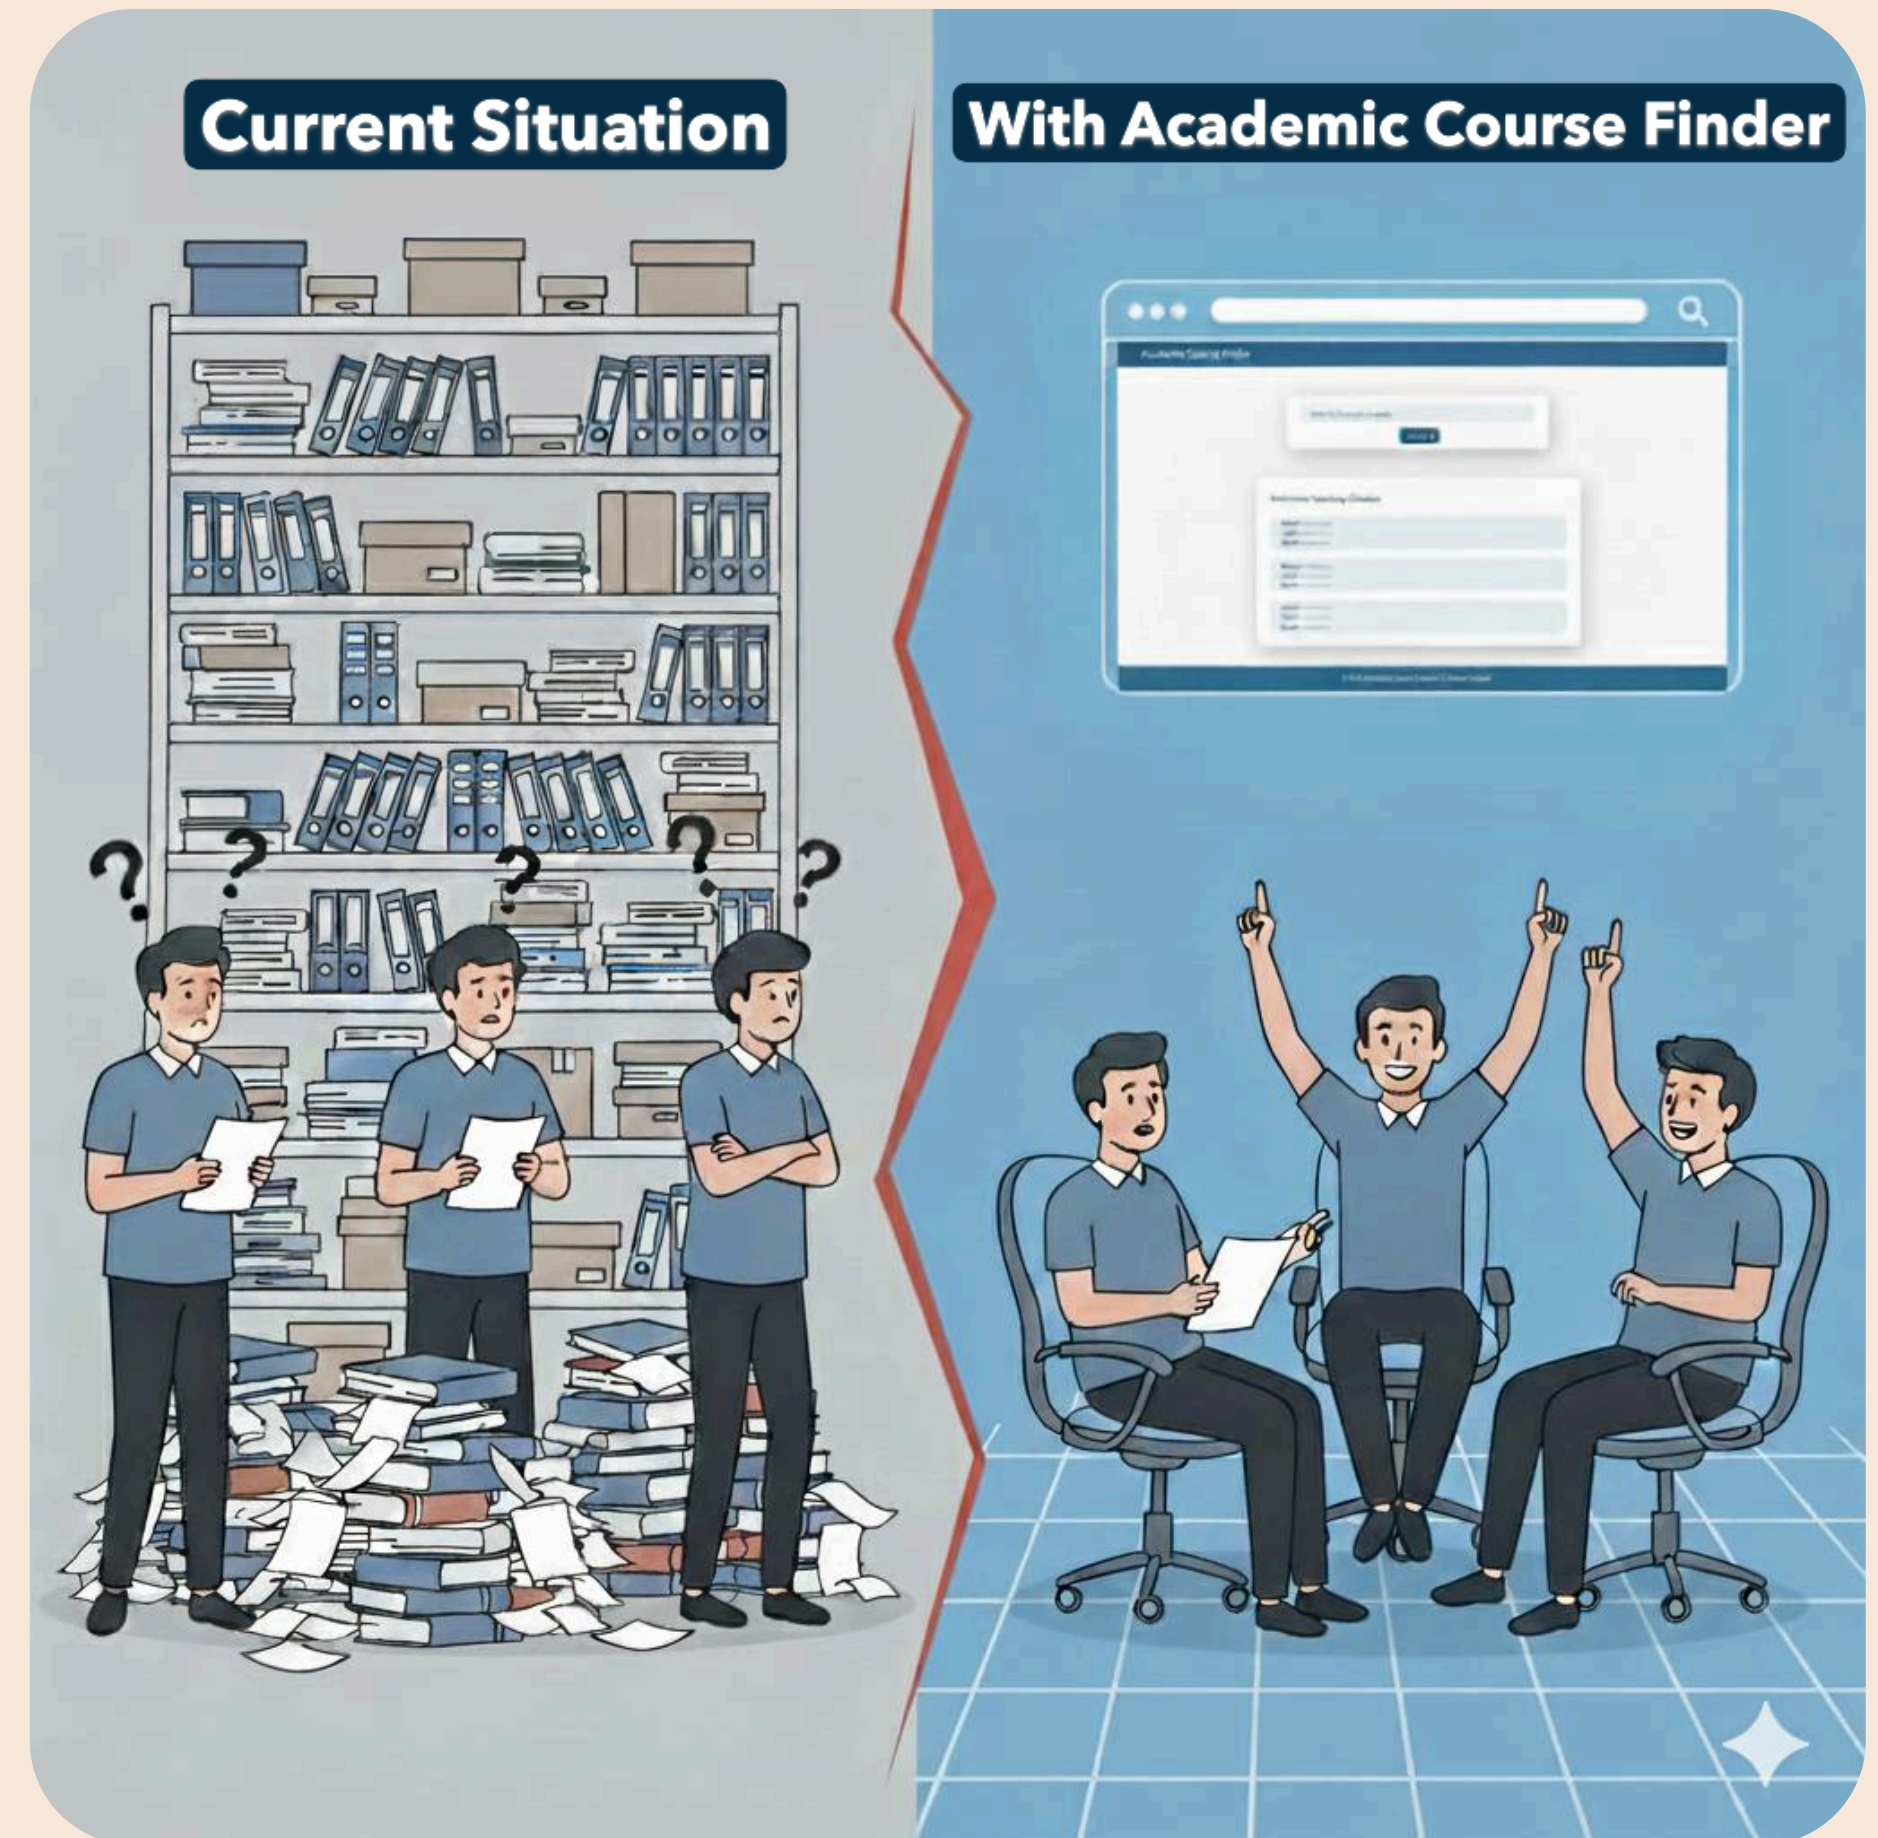

PROBLEM

Access to academic information is difficult and not centralized.

PROPOSED SOLUTION

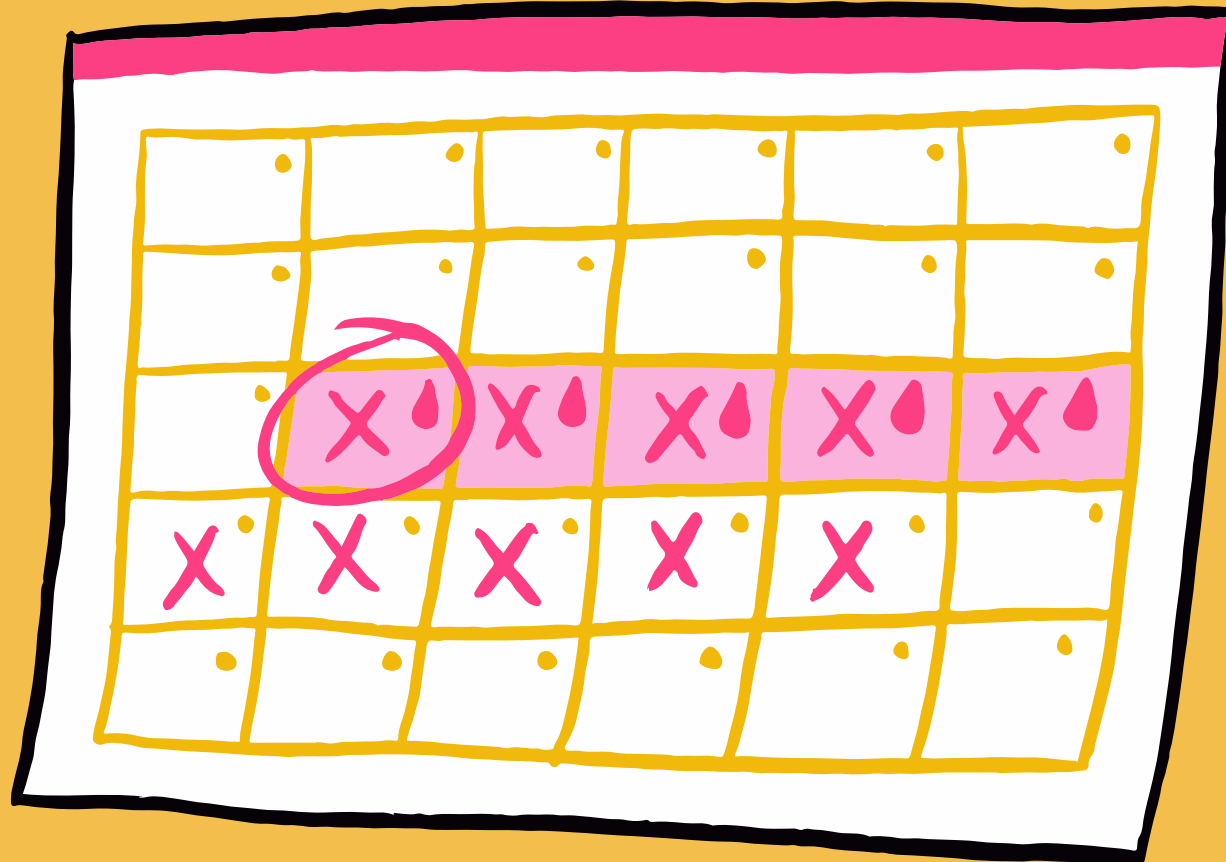

The Academic Course Finder Web Application solves this by creating one platform where:

- Admins manage teachers/courses
- Users search courses without login

VISION

Build a lightweight, modular web system that centralizes course information and formalizes instructor-course links, enabling fast search, clean data, and reliable planning.

PRIMARY OBJECTIVE

Deliver a web-based system for
course finding

VALUE PROPOSITIONS

- Search & Browse fast for course and instructors
- Creating link and unlink course-professor relationship.
- Admin UI for data management

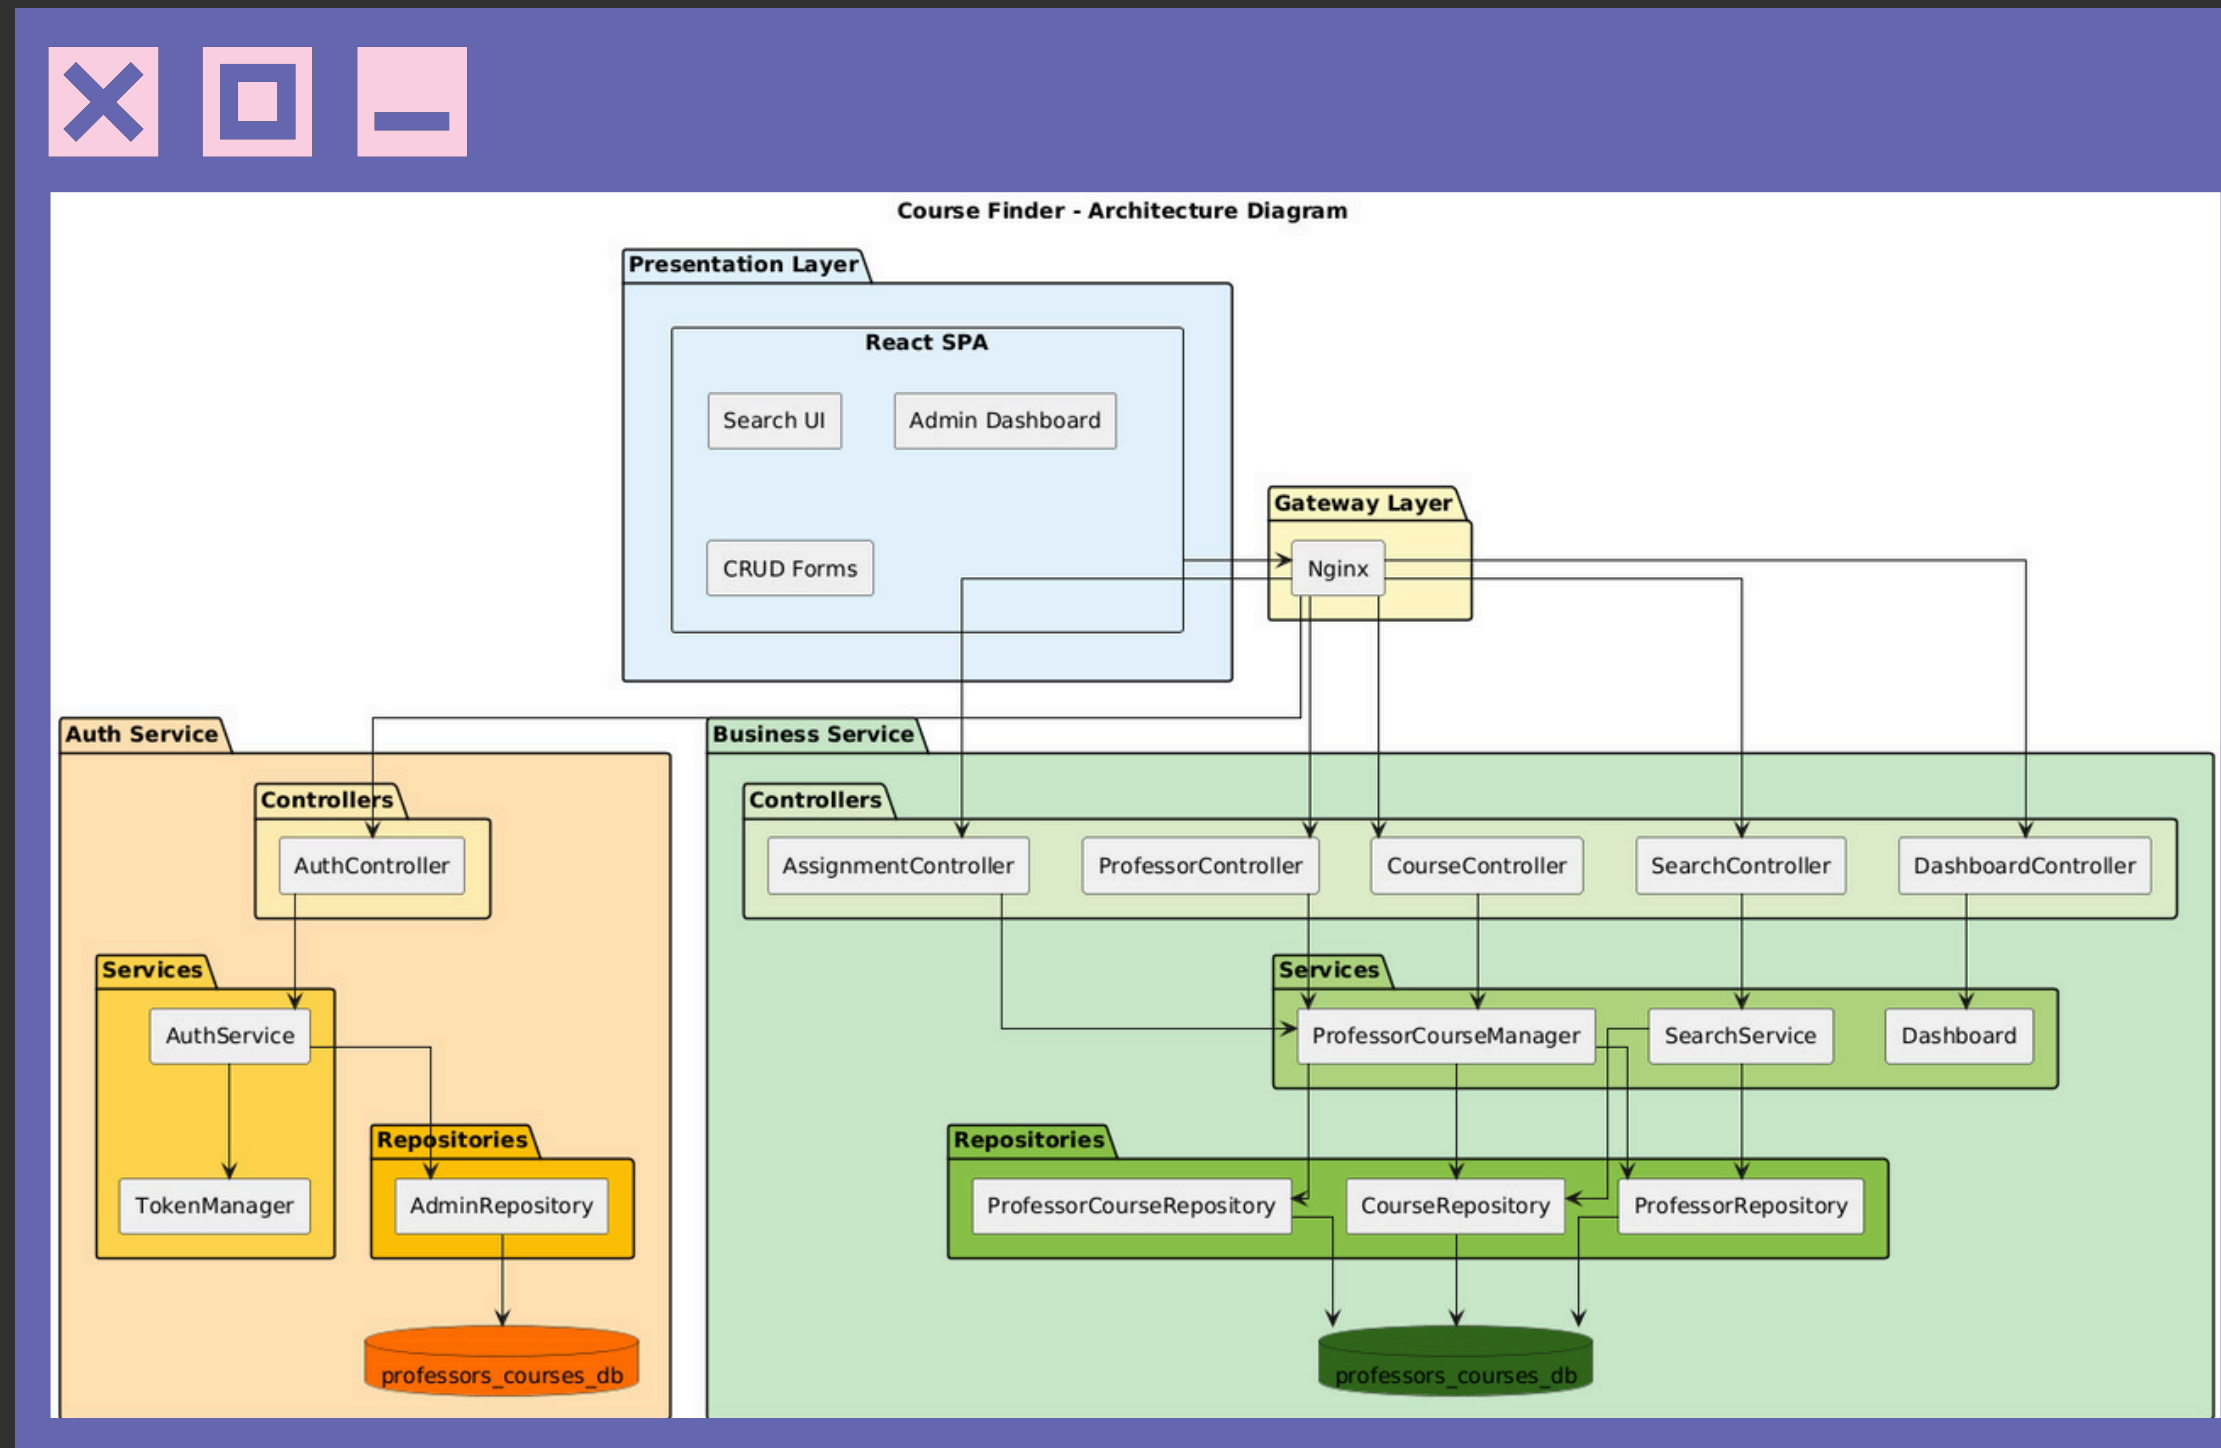

REQUIREMENTS AND USER STORIES IDENTIFIED

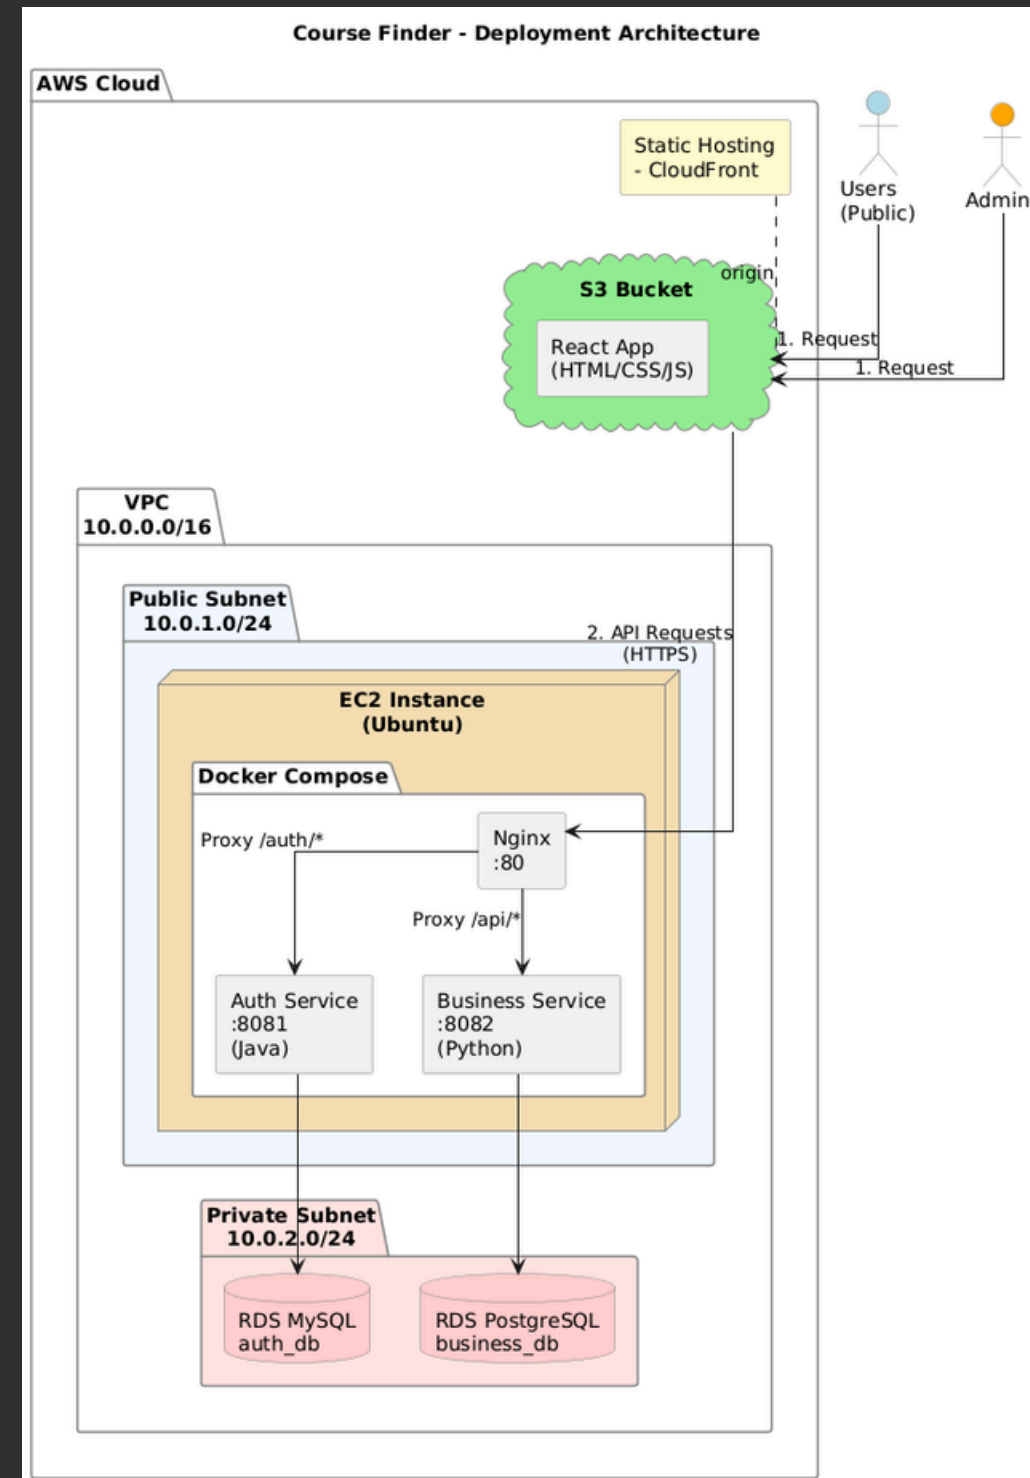

- The student want to search and filter courses by code/tittle or by teacher details.
- View course details and schedules.
- Admin users can upload data for crud operations, and can also link the two.

ADMIN DASHBOARD VIEW

RESULTS

**WORKING
TOGETHER**

- User stories and acceptance criteria, CRC cards validated and user story mapping
- High-level architecture & deployment views defined
- Early Web UI mockups for different views
- Draft data model and initial API contracts outlined

DISCUSSIONS

**WORKING
TOGETHER**

- Modular split supports separation of concerns and parallel work
- Risks in data standardization and search/filter performance

NEXT STEPS

UPCOMING DELIVERABLES

- Implement the first E2E slice (Auth + Core + UI).
- Publish OpenAPI (Auth/Core) and apply the initial DB schema with constraints.
- Write and run unit tests and a couple of acceptance scenarios.
- Prepare a docker-compose draft for orchestration and automate deployment
- Plan a baseline performance check for search and functionalities

THANK YOU!
